Plants are the basis of life on earth and are central to people’s livelihood. Glimpses of our knowledge in ethno-medicine are available to Vedic text and there is an inextricable link between indigenous culture and biodiversity as areas of high biodiversity are often found on indigenous community’s lands. Ethno botany involves the reciprocal and dynamic aspect of the interaction of indigenous people with plants. This precious knowledge needs to be properly documented and conserved for the benefit of the present and future generations. North-Western Himalayas in India are well-known for their rich floral diversity, traditionally used as home remedies and form an important part of Himalayan folk medicine. The local communities and rural populace of Shivalik hills use 12 climbers and 4 lianas (13 dicots and 3 monocots) belonging to 9 families for their ethno-medicinal importance. Local communities not only use these climbers and lianas but also care for their conservation and protection; thus contributing towards sustainable development.

Keywords: Ethnobotany, Ethno-medicine Biodiversity, Shivalik, Climbers, Lainas, ODA (Observed density & availability), TIV (Total importance value)

1. Introduction
The term ethnobotany was coined by J.W. Harshberger in 1895 to “the study of plants used by primitive and aboriginal people” [1]. Since then, the subject has been variously defined and interpreted by different workers as its discipline began to follow multidisciplinary approach combining a diversity of knowledge bases and methods through the use of anthropological methods [2]. Plants are the basis of life on earth and are central to people’s livelihood. Glimpses of our knowledge in ethno-medicine are available to Vedic text and there is an inextricable link between indigenous culture and biodiversity as areas of high biodiversity are often found on indigenous community’s lands. In wider context, it involves the reciprocal and dynamic aspect of the interaction of indigenous people with plants [3]. Unfortunately, traditions and practices are now under assault everywhere in the world under the impact of industrialization and changes in sustenance economy, and needs to be properly documented and conserved for the benefit of the present and future generations [4].

North-Western Himalayas in India are well-known for their rich floral diversity, traditionally used as home remedies and form an important part of Himalayan folk medicine. The state of Himachal Pradesh (H.P.), a green pearl nestled in the North-Western Himalayan mountain ranges (30°-22’ and 33°-12’ North latitudes, 75°-47’ and 79°-04’ east longitudes) is known for the natural beauty of its forests, rivers, valleys, hills and dales, which are rich in material resources as in cultural and human values. Shivalik hills or the lower hills of Himachal Pradesh in ancient times were known as ‘Manak Parbat’. It literally means the “tresses of Shiva”. Shivalik hills in Himachal Pradesh includes districts i.e. Kangra, Hamirpur, Una, Bilaspur and the lower parts of Mandi, Solan and Sirmaur. The altitude ranges from 350m to 1,500m above the sea level [5]. The information on floristic and ethnobotanical studies in India is scattered and meager [6-11]. Ethno-medicinal information in Himachal Pradesh (H.P.) and particularly, in shivalik hills is meagre in literature [12-17]. Keeping this in mind, the present study has been undertaken.

2. Materials and Methods
Intensive ethno botanical exploration were undertaken in the rural pockets of Shivalik hills in district Hamirpur, Bilaspur and Sarkaghat tehsil of district Mandi. The field tours were planned in such a way so as to collect the ethno botanically interesting species of climbers and lianas either in flowering or fruiting stage.
For a better understanding of local beliefs, habits and uses, different categories of people like family heads, healers, and old experienced and knowledgeable informants were repeatedly interviewed. Botanical identification of the selected species was first done with the help of regional floras i.e. [12, 18, 19]. For more information three basic approaches were adopted following Phondani et al., 2010 [20].

- An interview based approach- Questions from informants on ethnobotanical uses mainly from old experienced people.
- An inventory based approach- An inventory based approach is followed on following questions:
  - Whether whole plant or plant parts are used?
  - The season of flowering and fruiting
  - TIV (Total importance value) of these plants
  - The density of plants in the region
  - Whether the plant is used for one disease or for more than one disease?
- An interactive discussions approach with communities-
  - How to use plants?
  - Are they used singly or in combination?

The local names were also ascertained and recorded carefully in the field notebook with the assistance of local informants. The data were verified in different regions among the interviewers and showing the same plant sample, and even with the same informants on different occasions. Ethnobotanical lore was considered valid if at least three informants made similar comments.

Phenological pattern of the plants were observed to find out the seasonal variation while ODA (Observed density availability) was observed according to Sood et al., 2012 [21] in which plants were classified into abundant, considerable and rare extent. Economic valuation of all the presently recorded ethnobotanical species was also carried out to calculate the total importance values (TIV) on the sum basis of parameters like life cycle strategy, seasonal variation, abundance, season as per detailed methodology outlined by Belal & Springuel (1996) [22]. Nomenclature of these taxa was confirmed from Bennet (1986) [23] and Wielgorskaya (1995) [24].

3. Observations
The local communities of Shivalik hills (H.P.) use 15 (climbers & Lianas) in different types of herbal practices. These local communities are a rich depository of traditional knowledge, so a sincere effort has been made to get the information on these herbal practices which are depicted in Table 1.

Table 1: Ethno-botanically important climbers and lianas of Shivalik hills
